

## Procurement

Simplify purchase order entry, vendor collaboration and sample management while enforcing CSR compliance with smarter procurement processes.

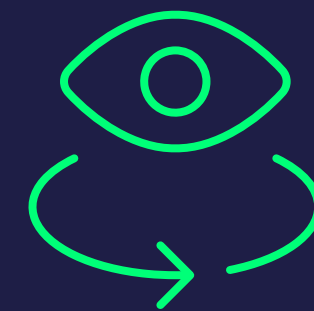

# Simple and Flexible Order Entry

Save time, reduce errors and manage everything from bulk orders to sample requests with easy order entry processes.

## Place Orders in Minutes

Create purchase orders quickly using intuitive matrices and ratio curves. What used to take your team hours now happens in minutes, with fewer errors and less frustration.

## Aggregated View for Full Control

Gain full control of your order lines with a user-defined aggregated view, allowing you to easily make changes at the product level and update details with a click.

## Support for Complex Purchase Types

Manage different purchase types, including sampling orders, through to purchase order categories that support unique processes like prototype and salesmen samples.

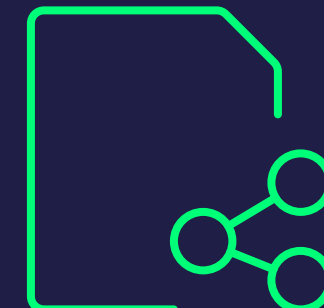

# Seamless and Transparent Communication

Keep suppliers aligned with your needs while streamlining communication with accurate, up-to-date information on every order.

## Vendor Portal Access

Collaborate effortlessly with vendors through a dedicated portal, where matrices and aggregated views make it easy for suppliers to engage in the ordering process.

## Data Sharing

Share Tech Pack reports and product specific details, while allowing vendors to add and update product measurements, transport measurements, HTS codes etc.

## Flexible Purchase Agreements

Easily manage trade agreements and vendor arrangements on a variant level, with automated charges calculated based on location and weight, providing accurate pricing from the start.

## Adding Purchase Order-Related Activities

The PLM calendar is enabled for capturing procurement related tasks and activities to follow and manage procurement progress. Vendors can be made responsible to report on tasks and activities.

# Drive Your CSR Agenda

Support responsible sourcing practices by ensuring vendors meet CSR standards, protecting your brand and upholding ethical business operations.

## CSR Validation for Responsible Sourcing

Meet CSR standards by setting classifications and capturing certification documents. This enables you to block or allow purchases from vendors based on CSR compliance, including at the production site level.

## Vendor Production Site Control

When vendors operate multiple production sites, you can easily identify and manage these sites, tracking CSR classifications and using these criteria to enforce sourcing policies.

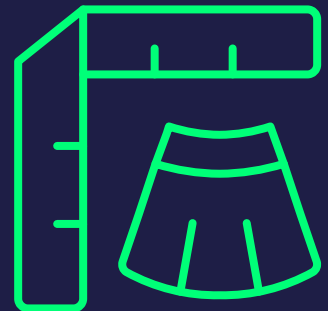

## Vendor and Factory Capacity Planning

Set production capacities at both vendor and factory levels. When a facility approaches maximum capacity, the system alerts you, or even blocks additional orders, preventing the ethical pitfalls that come from pushing factories beyond their capabilities.

# Manage Unique Procurement Needs

Simplify the procurement of different sample types while costing and managing each one separately for better visibility and control.

## **Tailored Sample Order Types**

Set up different purchase order types to manage specific sample needs, such as prototypes, size sets, or salesmen's samples. Each type can be managed separately for clarity and control.

## **Flexible Costing for Samples**

Easily calculate costs for each sample type using trade agreements, factoring in different volumes, cost prices, and geographical considerations to help with accurate costing.

# Maximise Margins

Gain full control over costs and margins, protecting profitability by ensuring all costs are visible and managed throughout the procurement process.

## Accurate Costing Calculations

Use top-down, bottom-up and mid-out calculations to set prices that protect your margins. Update individual cost elements and calculate accurately to the variant level, ensuring profitable pricing across your range.

## Margin Control on Purchases

Keep a tight grip on your margins by tracking purchase costs against pre-set targets, helping you remain on budget and avoid unexpected cost increases.

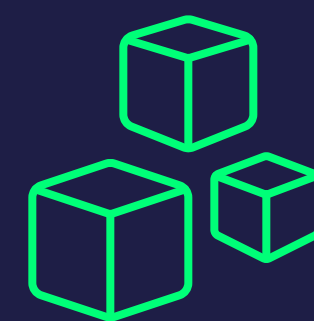

# Production Ordering

Simplify and optimise production your production orders with efficient and flexible processes.

## Master Production Orders

Group production orders on variant level together for an item to create a Master Production Order.

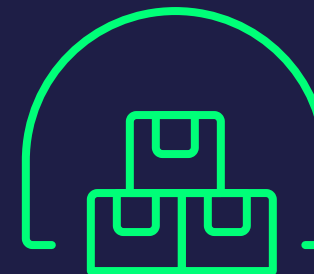

## Production Order Types

Distinguish between different types of production orders, such as sample orders and bulk production.

## Efficient Order Creation

Save time by automating the creation of Master Production Orders using intuitive wizards, matrices and ratio curves.

## Flexible Grouping

Following Master Planning, smartly group created planned production orders, based on selected dimensions and use of size ratio curves to optimise production and create master production orders with ideal quantities and size-breakdowns (e.g. to avoid exceeding the available lasts in a production run when producing shoes).

# Smarter Procurement Planning

Factor in the BOM details of products you wish to procure since MOQs and raw material lead times will affect the purchase orders of finished good products.

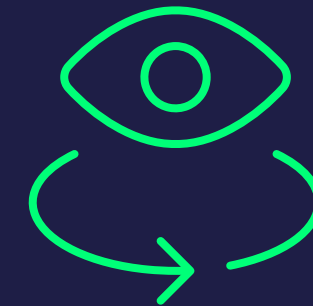

## Preview and Group Orders

Preview grouped planned order lines before firming them into actual purchase orders. Orders can be split by dimensions, periods, or other criteria, giving you control over how and when orders are placed.

## Hold or Adjust as Needed

Previewed orders can be firming when ready, or held for later, allowing you to make adjustments and ensure you are ordering at the optimal time and quantity.

## Raw Materials Overview

Before firming grouped planned orders into purchase orders, check the raw materials requirement to produce the planned purchase orders.

**K3 Fashion Solutions, a leading supplier of fashion business technology with more than 30 years of experience, develops industry-specific tools to support fashion workflows, improve customer experiences, and deliver sustainable growth throughout the supply chain.**

Our solutions, K3 Fashion and K3 Pebblestone, are fully embedded in Microsoft's Dynamics 365 ERPs offering enterprise-grade support from design and production through to retail. As a top 20 GISV with a global footprint delivered through our network of Microsoft implementation partners, we are committed to supporting brands of all sizes.

To learn more about K3 Fashion Solutions and how we can help your business, visit [k3fashionsolutions.com](https://k3fashionsolutions.com)

**K3 Fashion supports fashion businesses with all aspects of operations, such as planning, design, sourcing, purchasing, logistics, warehousing, and finance.**

Fully embedded in Dynamics 365 Finance, Supply Chain Management and Commerce, K3 Fashion presents a single solution to remove technical blockers, unify data sources and maximise margins
