

Product Development and Design

Manage product lifecycles, streamline sampling, and handle product data with ease to innovate faster and more effectively.

PLM Control at Every Step

Gain control over the entire product lifecycle, reduce delays and keep development on track with proactive alerts to prevent bottlenecks, using the PLM calendar.

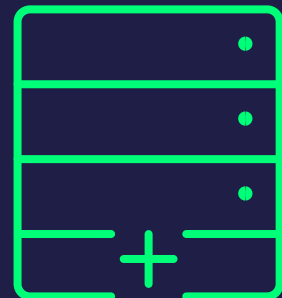

Automated Lifecycle Phases

Create and manage product lifecycle phases, assigning activities, owners, and groups for full visibility and control over development stages.

Mass Updates & Alerts

Easily update activities in bulk and alert users when deadlines are missed or upcoming to keep projects on track.

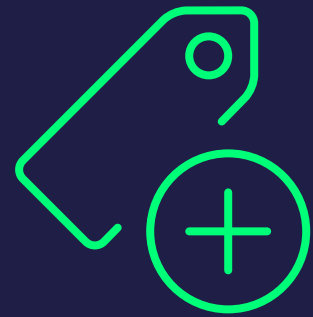

Template Plans for Mass Adoption

Use template plans to quickly apply lifecycle phases to seasonal or product lines in bulk to maintain consistency across categories.

Simple and Customisable Product Creation

Speed up the creation of new products and collections with easy-to-use tools that reduce manual input and maintain consistency across global operations.

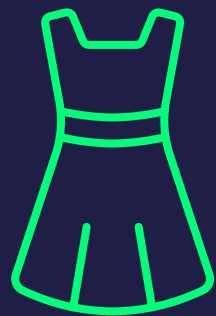

New Products in Just 10 Clicks

Generate and release new products across multiple legal entities in 10 clicks, using the Product Wizard tool.

Colour Management That Makes Sense

Create multiple colourways simultaneously with the Product Group Wizard, keeping them connected as a style for easier management across your entire range.

Style Master

The style master connects same items across different seasons, building a history that can be used in PowerBI, looking at historical performance and in demand planning to predict future demand, even on SKU level.

Simplified Product Data

Access codes, dimensions, images, seasons, collections and prices in tailored product data forms designed specifically for fashion. The information your team needs, exactly where they expect to find it.

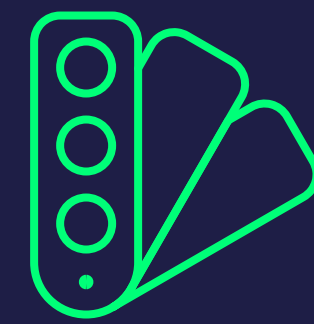

Sample Costing and Management Made Easy

Gain better control over the sampling process, reducing sampling costs, while having insight information around inflow, availability and outflow, e.g. to distributors and other showrooms.

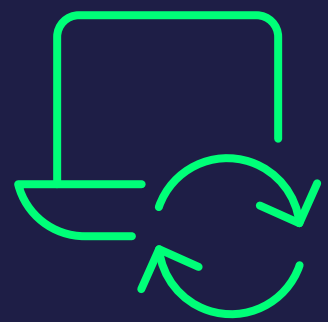

Efficient Sample Orders

Manage different sample types (like prototypes, size sets, photoshoot samples, and salesmen samples) with flexible purchase order categories and statuses to keep sample and bulk orders separate.

Allow Different Procedures for Samples

During development, details change constantly. Our system allows for the evolving nature of sample data, accommodating updates without disrupting your workflow.

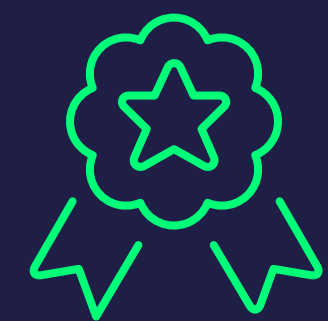

Product Status

Block certain activities during specific product stages while allowing sample orders to proceed, ensuring development continues smoothly while protecting production integrity.

Integrated PLM for Sampling

Guide products through the sampling stage within the PLM framework to maintain a structured and controlled process.

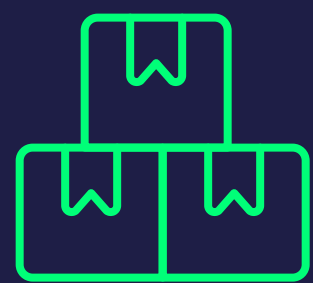

Quality Assurance Settings

Set specific quality checks for samples, like lab dip approvals, material tests, wear-testing, separate from bulk production requirements. When your samples pass rigorous testing, your production runs smoothly.

Collection and Season Management

Develop collections that meet seasonal demand while managing the release and delivery of products for optimal sales performance. Season and Collection management are available across the solution in all relevant areas.

Collection Management

Group products by collection while tracking price points to ensure your final product mix aligns with financial targets. Use collections as powerful filters throughout your system from allocation to pricing to markdowns.

Seasonal Control

Link products to specific seasons and delivery windows, timing product drops precisely to meet market demand. Filter transactions by season to maintain clarity across your business operations.

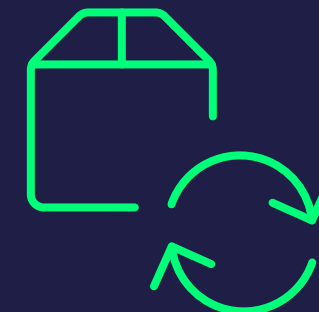

BOM Management

Using BOM Models, users can easily create and maintain BOM versions used with production orders. They can also be used when purchasing the end product.

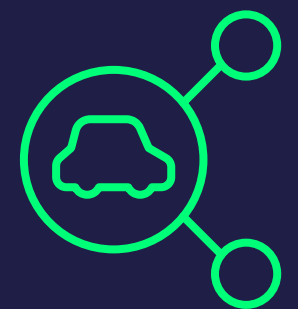

Predefined BOM Models

Set up and manage Bill of Materials (BOM) Models using predefined templates to standardise product components and usage across product variants. Templates allow text fields as placeholders that are replaced with actual materials when BOM models and versions are created for products.

Easily update BOM

Easily update BOM Models or add new versions as product designs evolve, using templates and copy functions.

3rd Party Materials

Capture materials on a BOM Model that will not be used in any transactions. The material can still be captured, since it is relevant for the product, while not relevant for transactions.

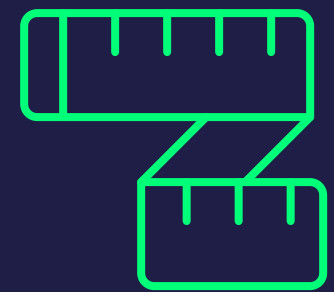

BOM Models on Tech Packs

Choose exactly which BOM details appear on tech packs, ensuring manufacturing partners have all the information they need, including supplier-managed components like thread specifications.

Maintain Quality and Fit

Guarantee consistent quality and fit, reducing returns and improving customer satisfaction with standardised measurement data.

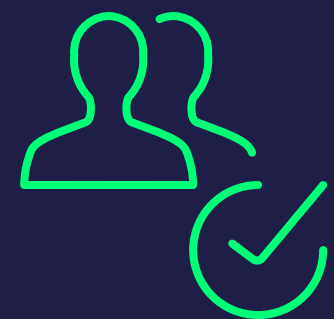

Standardised Fit and Measurements

Define fit standards and block measurements through templates to maintain consistency across all styles and sizes.

Product Measurements

Use template measurements or copy measurements from another product to start building a measurement set for a product.

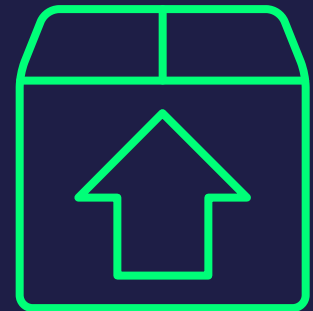

Seamless Vendor Collaboration

Share measurements with suppliers through a dedicated portal where they can update product measurements and add comments. Review changes before acceptance, maintaining control while streamlining communication.

Master Production Orders

Keep sample production separate from bulk manufacturing to maintain focus and prevent errors.

Master Production Order Wizard

Easily create master production orders using matrices and ratio curves. Select the correct production order category to identify the created master production order as a sample production order.

K3 Fashion Solutions, a leading supplier of fashion business technology with more than 30 years of experience, develops industry-specific tools to support fashion workflows, improve customer experiences, and deliver sustainable growth throughout the supply chain.

Our solutions, K3 Fashion and K3 Pebblestone, are fully embedded in Microsoft's Dynamics 365 ERPs offering enterprise-grade support from design and production through to retail. As a top 20 GISV with a global footprint delivered through our network of Microsoft implementation partners, we are committed to supporting brands of all sizes.

To learn more about K3 Fashion Solutions and how we can help your business, visit k3fashionsolutions.com

K3 Fashion supports fashion businesses with all aspects of operations, such as planning, design, sourcing, purchasing, logistics, warehousing, and finance.

Fully embedded in Dynamics 365 Finance, Supply Chain Management and Commerce, K3 Fashion presents a single solution to remove technical blockers, unify data sources and maximise margins
